

Don't forget to test your Live web pages.

Use your new GitHub Pages link to test that your links work and that your images are displayed correctly.

### Troubleshooting Guide

- Below is a list of the most common issues you might run into when trying to do Github Pages deployments.
- **Forgetting to git "add -A, git commit -m":** Don't forget to save (git add -A OR git add .) and commit (git commit -m "Enter a commit message here") your changes prior to pushing to GitHub. Your site will be blank if you forget to do this. As a starting point, ensure their code is present in GitHub.
- **Didn't name the repo correctly:** Please make sure you use the following pattern: `_username_.github.io`
- **Images and/or CSS not appearing:** All filenames and paths are case sensitive. Ensure that all links in HTML are using case-sensitive paths that match the folder directories casing.
- **Not using relative paths:** Do not use absolute paths to reference your CSS or image files. Convert these to relative paths.
- **Not knowing where the site deployed:** Your site files are deployed to your GitHub repo. Login to GitHub to confirm your files are there. Your site url should follow this pattern: [http://\\_yourGitHubUserName.github.io](http://_yourGitHubUserName.github.io) or [http://\\_yourGitHubUserName.github.io/\\_YourRepoName/](http://_yourGitHubUserName.github.io/_YourRepoName/) If you still cannot see your pages try adding the page name to the end of your url => [http://\\_yourGitHubUserName.github.io/index.html](http://_yourGitHubUserName.github.io/index.html) or [http://\\_yourGitHubUserName.github.io/\\_YourRepoName/index.html](http://_yourGitHubUserName.github.io/_YourRepoName/index.html)
- Beyond that... Good luck!
